DYNAMIC IMPACT MEASUREMENTS

Dynamic Impact Measurements and Verification for vessels

A+D have available a full-size measurement rig for doing real-time Dynamic Impact measurements and to calibrate or verify other instrumentation systems or calculations. The designed measurement range is suitable for medium sized vessels such as a CTV or other workboats.

The vessel can also be equipped with Vessel Motion Measurement System (VMMS) for further detailed measurements and analysis of the vessels behaviour and dynamic response. We can assist in preparing a test program, supervising the actual testing as well as full analysis of the data and reporting when the testing is finished.

Please contact A+D for more details.
